

ResolveX – Agentic Customer Recovery & Business Intelligence Platform

Problem Statement

Traditional customer support systems treat complaints as isolated tickets. They primarily focus on providing responses or closing cases, often overlooking the underlying operational issues, customer context, and long-term business impact. As a result, businesses repeatedly encounter the same problems, lose valuable customers, and miss opportunities to improve their internal processes.

Our Solution

ResolveX is an **Agentic AI-powered Customer Recovery & Business Intelligence Platform** that transforms customer complaints into actionable business intelligence. Instead of simply responding to customers, multiple specialized AI agents collaborate to investigate the complaint, understand the customer's history, evaluate business impact, determine the best recovery strategy, and initiate appropriate business actions.

The platform not only resolves customer issues but also helps organizations identify recurring operational bottlenecks, improve workflows, reduce churn, and continuously enhance customer experience.

Multi-Agent Architecture

The platform consists of multiple AI agents, each responsible for a specific task:

- **Orchestrator Agent** – Coordinates all agents and manages the end-to-end workflow.
- **Complaint Analysis Agent** – Understands the complaint, classifies the issue, and determines urgency and possible root causes.
- **Customer Intelligence Agent** – Analyzes customer history, purchase behavior, previous interactions, loyalty level, and churn risk.
- **Knowledge Agent** – Retrieves relevant company policies, FAQs, warranty information, SOPs, and similar past cases using a knowledge base.
- **Business Impact Agent** – Evaluates the potential impact on revenue, customer retention, brand reputation, and operational risk.
- **Decision & Recovery Agent** – Determines the optimal recovery strategy based on all collected information.
- **Action Agent** – Executes or recommends actions such as refunds, replacements, escalations, CRM updates, notifications, or follow-up scheduling.
- **Continuous Learning Agent** – Identifies recurring complaint patterns and recommends long-term business improvements to prevent similar issues.

Workflow

1. A customer submits a complaint through the platform.
2. The **Orchestrator Agent** assigns tasks to the relevant AI agents.
3. The **Complaint Analysis Agent** understands the issue and extracts key information.
4. The **Customer Intelligence Agent** gathers customer-specific insights.
5. The **Knowledge Agent** retrieves relevant company policies and historical cases.
6. The **Business Impact Agent** evaluates the potential business consequences.
7. The **Decision & Recovery Agent** selects the most suitable resolution strategy.
8. The **Action Agent** carries out or recommends business actions such as ticket prioritization, refunds, replacements, notifications, or escalations.
9. After resolution, the **Continuous Learning Agent** analyzes trends across complaints to uncover recurring operational issues and suggest process improvements.

Expected Impact

ResolveX goes beyond traditional customer support by combining complaint resolution, intelligent decision-making, workflow automation, and business process improvement into a single Agentic AI ecosystem. Rather than simply answering customer queries, it helps businesses recover customer trust, automate operational decisions, reduce recurring issues, and drive continuous organizational improvement.
